# NO LIMITS

**It's not enough just to have powerful pieces of technology. Those pieces must work together.**

**DXC orchestrates individual tools into integrated systems.**

# Who is DXC?

---

## Digital Leader

- DXC is leading a major digital transformation program for a large defense firm to help capture \$650M in operations while increasing speed.

## Trusted Leader

- Commercial expertise with more A&D companies trust DXC to provide their IT services than any other company.

## ITAR Leader

- #1 IT provider at global top 10 AD firms providing extensive International Traffic in Arms (ITAR) based services.

## Experience

- Together with our partners, we have the skills to understand the lifecycle processes, and a vast array of installed systems.

## Scale

- Competence to deliver complex AD projects at global scale.

## Wide Portfolio

- Ability to deliver ongoing applications maintenance and change capabilities globally. DXC supports full vertical solutions and employee experience strategy to acquire and retain top talent.

# The Data Drag on Digital Transformation in A&D

Competing needs throttle transformation

## Cost Control

**High sustainment costs.** Sustainment cost of maintaining newer equipment is substantially higher than in the past. Improved predictive maintenance programs leveraging the vast amount of new data is seen as a solution.

## New Work Methods

**Employee accessibility.** A&D are more susceptible to dealing with a mix of paper and electronic work instructions. These customers are looking for novel ways to communicate and streamline work processes with employees (e.g. interactive diagrams on mobile devices).

## Security

**High risk data.** Awareness of the Cloud/cyber activity issues, solutions that can enhance security can stand apart from other options. A&D may not be as quick as other industries, but they have a complexity rate that is increasing.

## Emerging Tech

**Disrupting field operations.** Technology such as 3D printing makes it possible for deployed ships to manufacture more replacement parts while at sea, reducing downtime.

## Dynamic

**Streamlined processes.** Transition from linear, document-centric processes to **dynamic, digitally-connected** processes accelerates millennial time to value thus maximizing the advantages of a digital ecosystem.

## Speed

**Supply chain optimization and readiness.** Whether they make engines or aircrafts, they all have big order books, they just can't **get their stuff out of the door fast enough**. Keeping equipment maintained well beforehand so it is "ready" when needed.

## Optimized

**Production modeling.** Engineering in a digital environment through modeling and simulation. This allows customers to better understand, **predict and optimize the performance** of each unique product. This digital representation can be done for an individual asset, an integrated system of assets or a fleet of assets.

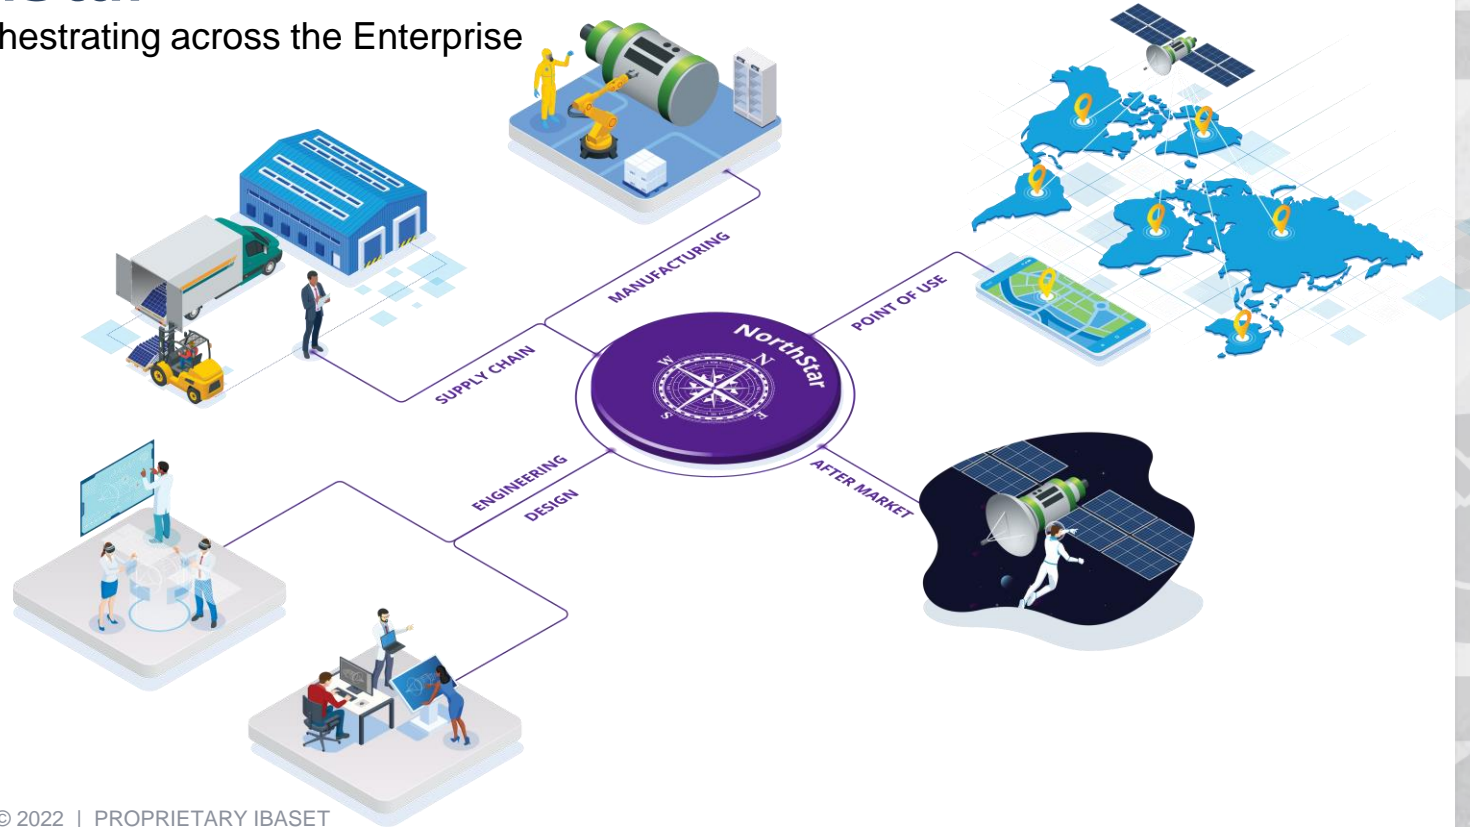

## Enabling Talent

**Un-enabled Vision.** The industry **does better** than others to discern a digital vision and to make the investment, but **lags behind in the digital enablement** leveraging data & analytics, effectively
